Features Available to Current *PATHLOGIX*® Customer Who Refer New Customers to *PATHLOGIX*®

- A new navigation feature that can save everyone who uses the software a considerable amount of time will be added to the surgical pathology case entry form. The existing “Previous” and “Next” navigation buttons are based on the sequence in which cases were created. Two new navigation buttons will be added. The new buttons will enable you to navigate based on accession numbers.
- A second new navigation feature will enable you to select and navigate to cases that have not been printed since they were finalized. This will help to eliminate a frequent error.
- The ability to select and navigate to cases that are marked as complete but not final will be added. This will enhance the usefulness of the complete check as a staff-pathologist communications tool and will make it much faster for pathologists to identify and navigate to cases that need his or her attention.
- The ability to color headers of selected report formats will be added.
- A new feature will be added to the form that enables you to batch print labels for multiple cases on a single page of labels. This new feature will enable you to print bottle and slide labels in order of accession numbers.
- The automatic assignment of accession numbers will be added to prostate reports, and a combined lookup of prostate cases and other surgical pathology cases will be added to the surgical pathology menu.
- A new “Initial read or consult” field and dropdown will be added to the surgical pathology case entry form.
