Clinicians Are Increasingly Getting the Picture

Pathology reports can often be quite wordy. By necessity. The details are critical.

So, when you're documenting a diagnosis, how much is a picture truly worth? A thousand words?

While it may be hard to quantify, there's no doubt an increasing number of clinicians are finding reports with images more helpful than reports without. The images can further confirm the clinician's impressions, aid in patient education and, in some cases, advance the clinician's knowledge and understanding.

With that in mind, PathLogix AP software has increased and enhanced the image management capabilities of its surgical pathology and prostate modules, with the most dramatic new capabilities in prostate reporting. The updated [PathLogix prostate report](#) provides a visual representation of diagnoses complete with Gleason scores and infiltration rates. This diagram, which can be used either color-coded or in black and white, offers clear, distinct documentation of the patient's condition.

The PathLogix prostate module also makes report generation much simpler through intuitive diagnosis building. Users may simply enter the appropriate information in the prostate gross description area. In addition to having that information displayed automatically on the diagram, the user can generate a textual diagnosis with a single click of a button...even for a multiple-specimen case.

Click on the appropriate link here to view either a [sample Prostate report](#) or a [sample Surgical Pathology / Dermatopathology report](#). For more information, contact PathLogix at 888/454-5000 or send an email to jerry@pathlogix.com.
